Out of all the features, the most impressive are the “markers.” Markers now line up the edges of layers. The result makes it incredibly easy to quickly align photos and other things by matching them against a known line. The automatic masking is excellent, too. Overall, I can't think of a tool that integrates so many useful features like Photoshop does. It's been a very big help. When asked about features that it doesn't have yet, the developer, Nik Software said: “If the community wants it, we can definitely make it happen.” It's hard not to be a little envious.

[b] Has more than matched the strengths of Lightroom, seen at the beginning of this review, while showing off some nice new features. It's not just a matter of improved handling in the image-editing module. Even larger improvements in performance and layout were made. For example, saving the latest session as a Workspace enables you to jump right back to the same settings as you left them when you reload it. You can then further customise the workspace as you wish. The net effect is that you can customise a new workspace in seconds. The editing module is just as powerful as before, too. After a session is completed, the automatic Intelligent Repair tools are still quite useful. They can improve much-needed sharpness and reduce noise. Better color accuracy is another nice feature. However, I still couldn't get the Scene Selector to work correctly. I don't see how a tool that does all the work for you could be such a big deal and not be better. Perhaps there's something I'm missing. I've also heard that they've improved the blending of scanned images. It's possible that they've done more tweaking to it rather than improving the algorithm.
